

Advice

Upon using Trading Signal - FxPort Daily Signal System, it might happen that we start with minor losses. This is due to the fact that not all pairs of foreign exchange are tied down, or a signal wave has just finished and we should wait for a week for the next signals, or we just join in a current sidle.

Characteristics of some cases that inexperienced tradesmen might find it difficult to endure or might blame the strategy for it:

- 1. we never get in at the bottom of the trend and never get out at the top of it.
"one cannot buy at the bottom, and cannot sell at the top"**
- 2. it might happen sometimes that the rate of exchange moves to the opposite direction after the opening of the position but by the end of the day or the next day the trend settles in the direction indicated by the strategy, and continues, our position will be positive. On a monthly basis the profit is more than the deficit.**

Please note that we do not know any trading model which merely makes profit without deficit. There is deficit in every trading strategy, however, risk management helps minimize losses. Based on the test results and live-account application of our strategy, the profit is higher than the deficit.

Important

You should plan the trading of foreign exchange in the long run, and wait patiently for the signals. Observe the proposed application of our strategy.

It is really important not to take occasional losses as personal failure, trust the strategy.

This is how you will be successful on the world's biggest market, called FOREX.

We wish good luck and transactions rich in pips for everyone.

From January, 2009 we have already two signals. **TA-Daily Signal** – this guaranteed in the last year **500-1500 pip/months profit** – gives the signal daily at 11pm.

Our new strategy - **FM-Daily Signal**, was tested last year – operates not only on a technical basis but we mostly apply fundamental items.

The basic service will include these signals as well. Typically, they come after 3 pm but there is no predefined point of time. As it is mostly based on fundamental decisions, there is enough time to tie the signal. One does not need to sit immediately by the computer. 10 or 15 minutes discrepancy is not a problem, these positions are kept for 2 or 3 days, or you can get the signal in a text message. Signals are rarely given, nevertheless, when they are given the profit potential is high, eg. 200-300 pips/position.

Signals can come in two ways:

The trading signalling system sends a message daily at 11pm (with the exception of Friday and Saturday) via e-mail or text message. If there is any technical error and you do not receive a signal you are able to enter the paying zone on the website (with a user name and password previously given by you) where you can find the actual signal as well as the data sent to you the previous week.

The message contains the name of the pair of foreign exchange, the opening price and direction, the stoploss and the position closing price.

Signals have three types:

PAIR OF FOREIGN EXCHANGE 1,3550 LONG -open long, (buying at EUR/USD 1,3550)

PAIR OF FOREIGN EXCHANGE 1,3550 SHORT -open short (selling at EUR/USD 1,3550)

PAIR OF FOREIGN EXCHANGE 1,3550 NO TREND CHANGE –no change in open position.

The system follows 12 pairs of foreign exchange continually.

Example of trading signal:

EUR/USD 1.4945 - LONG S/L: 1.4845, TP: 1.4995.

The order must be given immediately.

(if the rate has changed a bit compared to the order, it should not be taken into consideration.)

Simultaneously with the giving of the order S/L and TP must be adjusted.

Our trading signal can be used by those FOREX traders, who:

- are not able or do not want to sit by the computer 6-8 hours a day.**
- do not have enough experience in trading with foreign exchange but want to be successful traders.**
- want to achieve higher profit than with bank interests.**

For successful application of the trading signal please note that you should keep the rules of the strategy completely.
